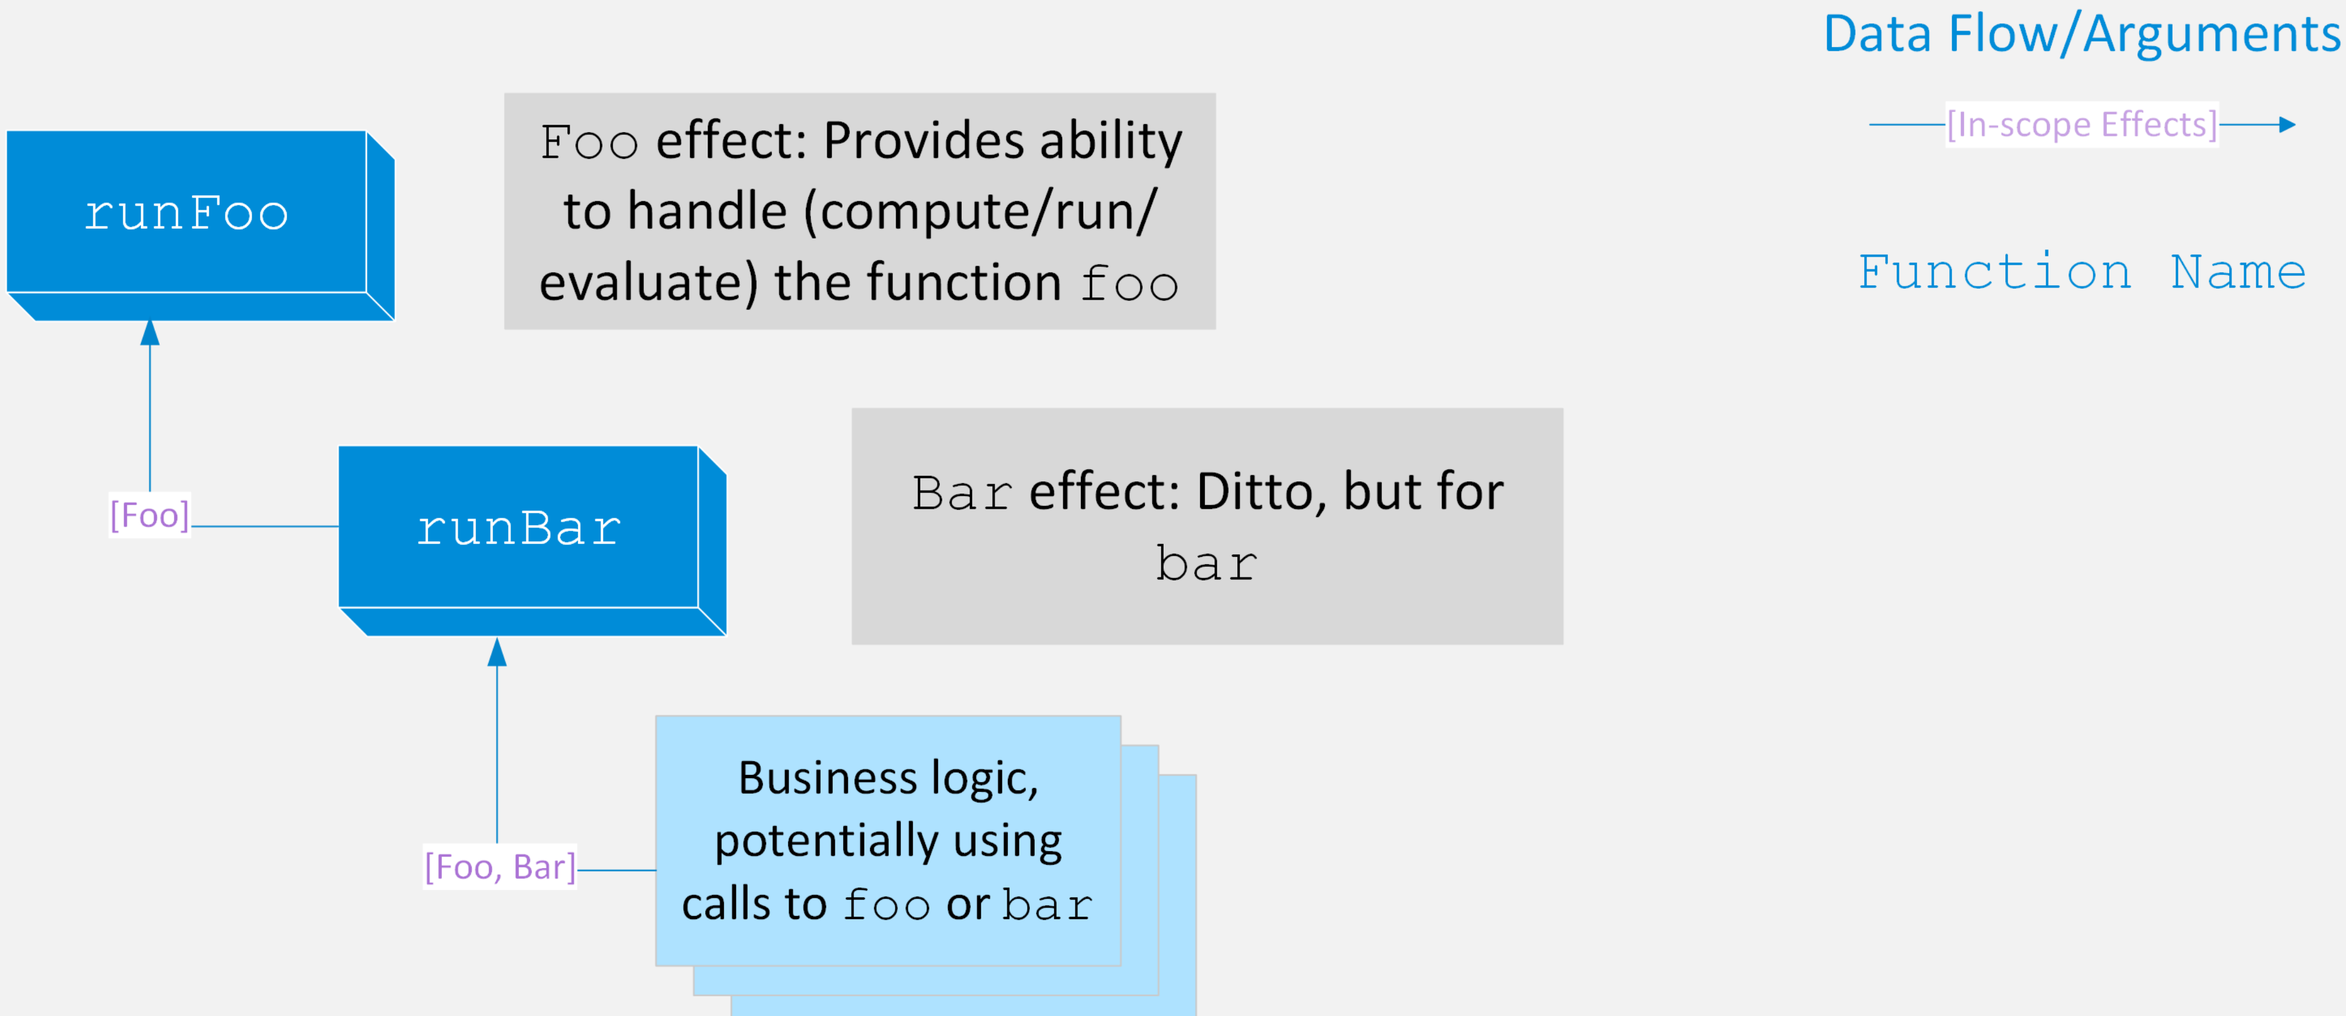
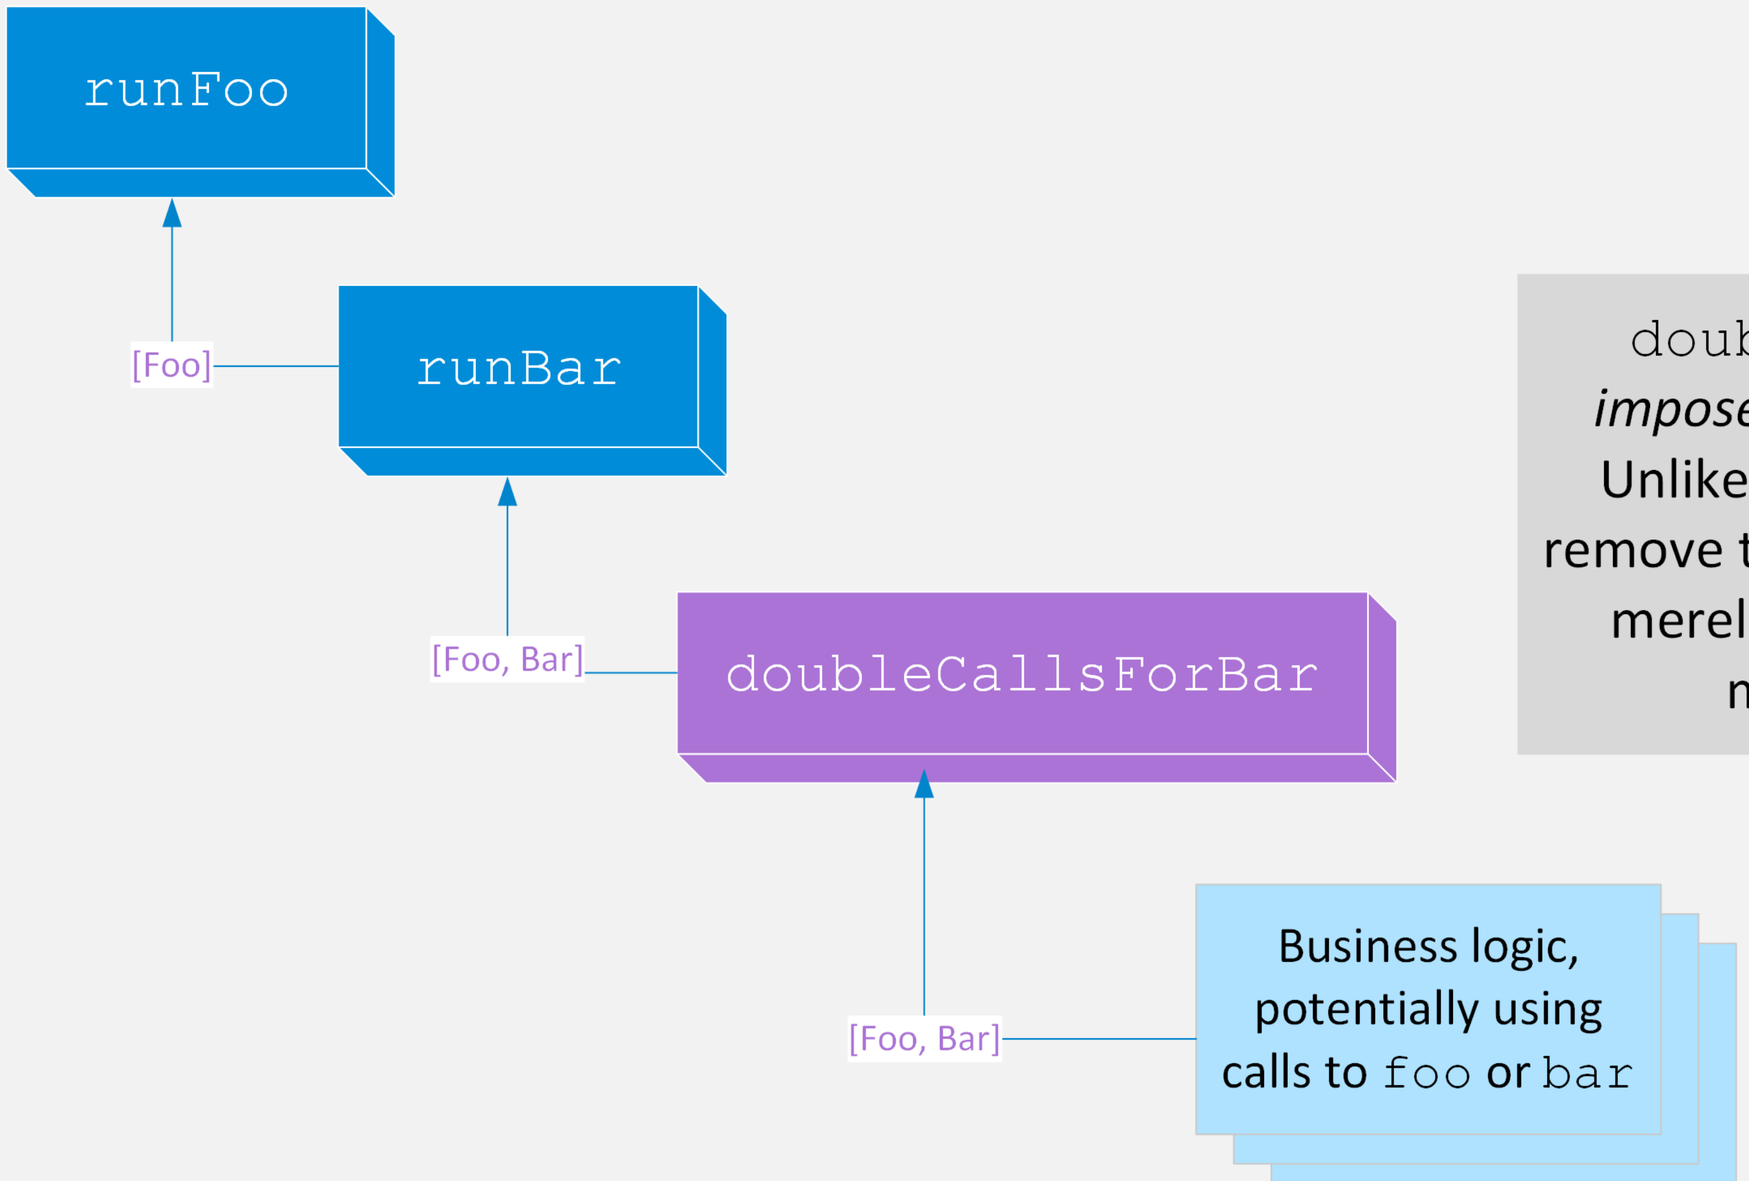
Primer: Function Calls with Algebraic Effects (in Principle)

(Call Stack Growing Downwards)

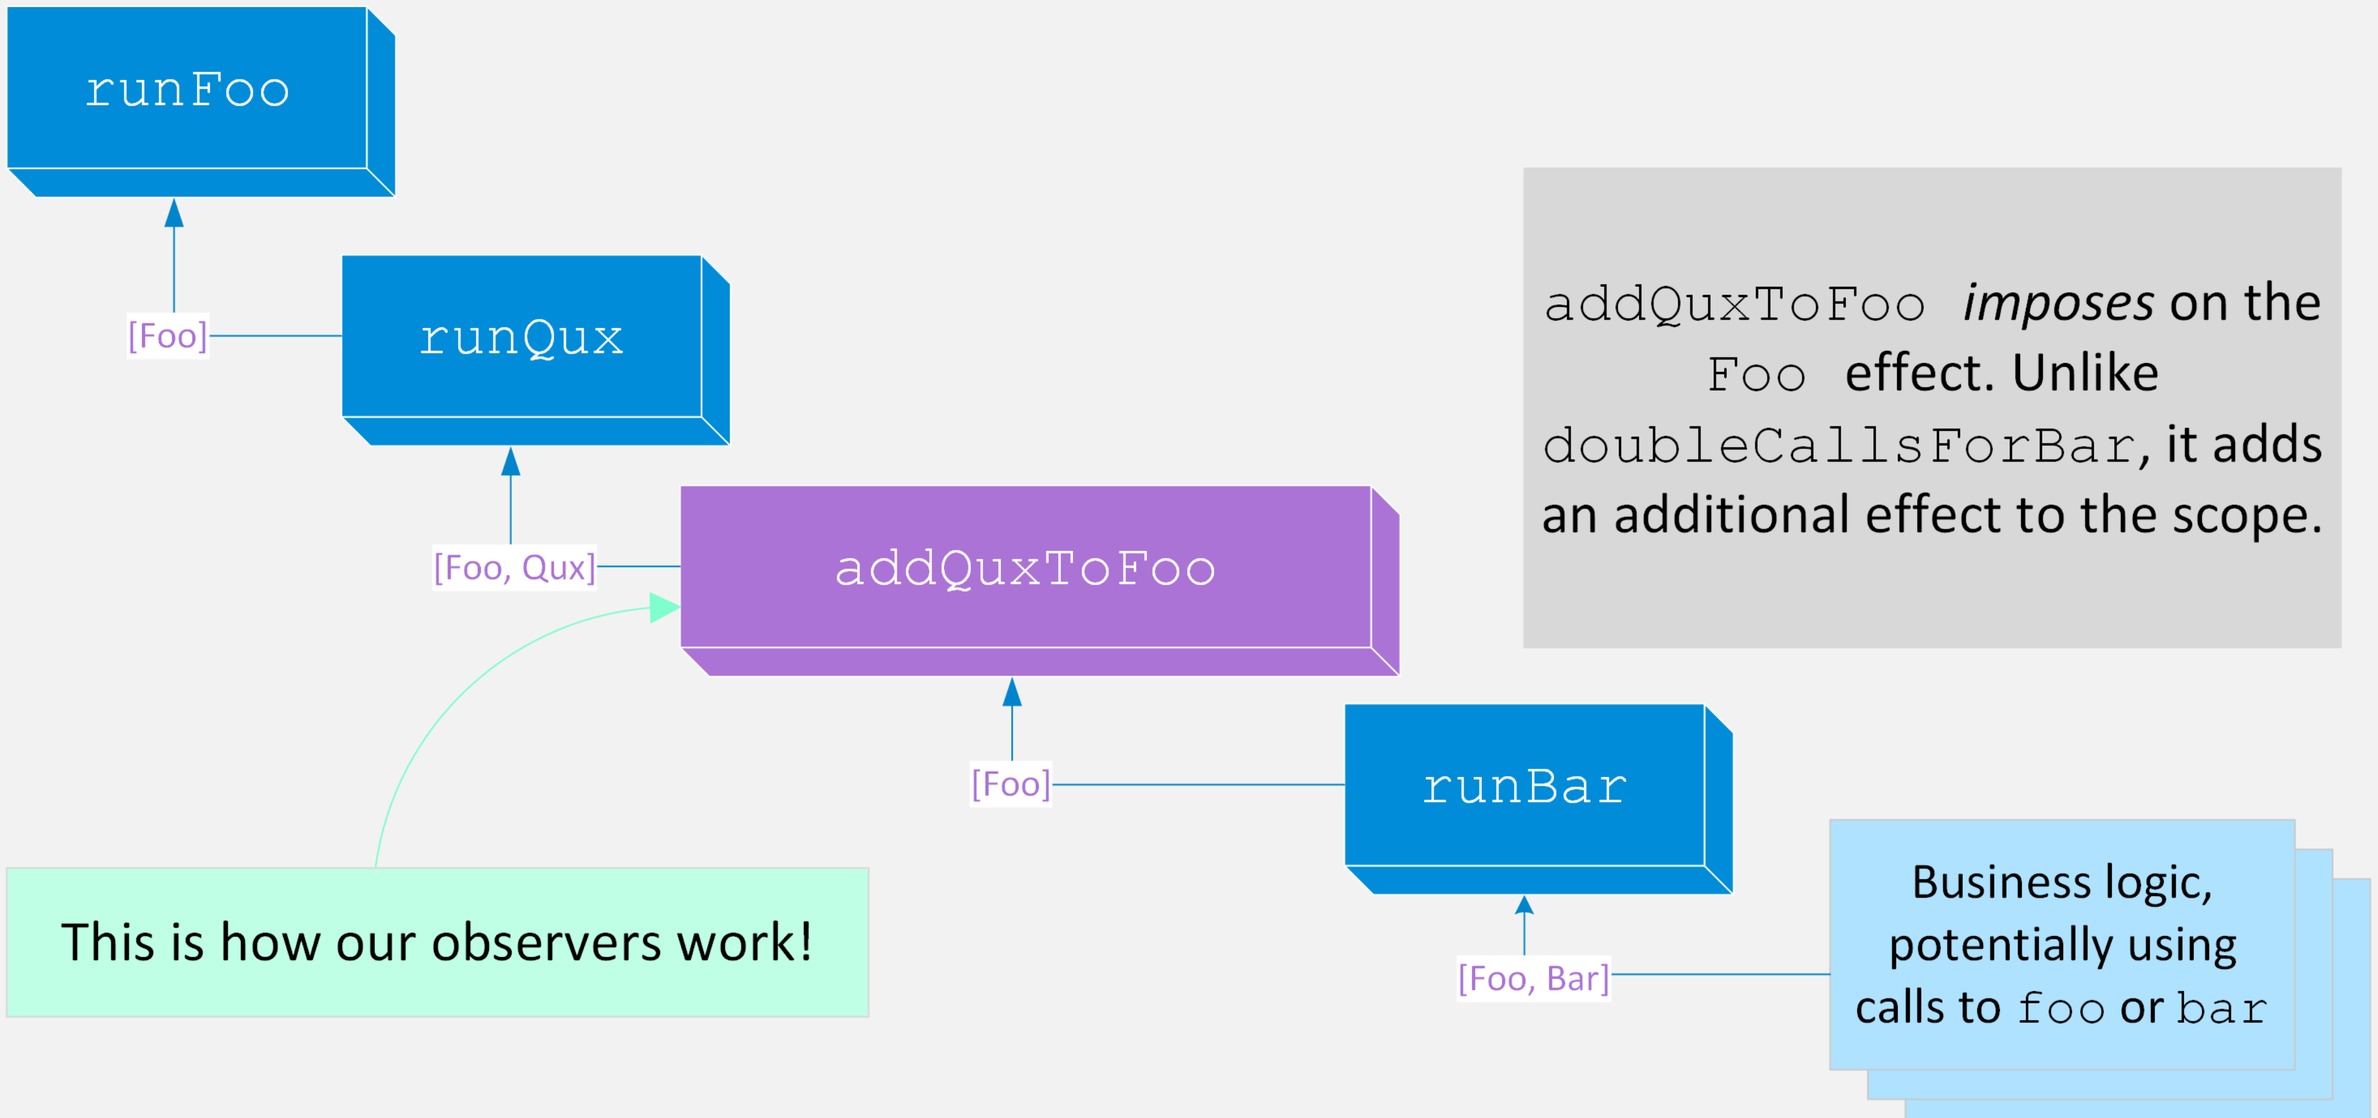


Effect Imposition and Interpretation



`doubleCallsForBar` *imposes* on the `Bar` effect. Unlike `runBar`, it does not remove the effect from scope. It merely provides additional meaning to `bar`.

Effect Imposition and Interpretation (Cont.)



`addQuxToFoo` *imposes* on the `Foo` effect. Unlike `doubleCallsForBar`, it adds an additional effect to the scope.
